D DEPLOYGUARD

STARTUP PITCH DECK

Cloud delivery, under control.

AI-powered AWS deployment & operations platform

From application code to controlled, verifiable AWS operations.

FOR STARTUPS • DEVELOPMENT TEAMS • AGENCIES

AWS delivery is fragmented.

Small teams coordinate a full infrastructure stack before they can reliably ship software.

01

Tool sprawl

Code, builds, configuration, cloud infrastructure and observability live in different tools.

02

Limited DevOps capacity

Startups cannot always dedicate engineers to platform architecture and operations.

03

Risk without visibility

Security issues, hidden cloud costs and unclear requirements surface too late.

04

Difficult recovery

Failed releases, rollback and resource cleanup demand specialized AWS knowledge.

THE IMPACT

- More manual work
- Slower releases
- Cloud uncertainty

One workflow. Four critical capabilities.

DeployGuard brings the AWS application lifecycle into a single, governed experience.

01

UNDERSTAND

Discover framework, dependencies, build settings and runtime requirements.

02

PLAN

Generate validated AWS options with transparent cost and security information.

03

DEPLOY

Approve and execute workflows through GitHub Actions, Railpack and Terraform.

04

OPERATE

Verify health, monitor releases and manage safe rollback and cleanup.

CONTROL REMAINS WITH THE CUSTOMER

- Customer-owned AWS
- Approval-gated execution
- Verified outcomes

From a prompt to a verified release.

A natural-language request starts the workflow; engineering evidence determines what can run.

> *“Deploy my Node.js API to AWS, minimize unnecessary cost and enable monitoring.”*

01

DISCOVER

- Connect GitHub repo
- Analyze dependencies

02

DESIGN

- Resolve missing inputs
- Compare eligible plans

03

GOVERN

- Review cost & security
- Approve the plan

04

OPERATE

- Deploy to AWS
- Verify and monitor

AI proposes. Validated plans execute. Users approve consequential actions.

The DeployGuard Intelligence Harness

An evidence-grounded control layer, not a chatbot that blindly generates cloud commands.

ENGINEERING EVIDENCE

→ **Governed AWS actions**

Evidence • Approval • Verification

Application intelligence	Understands code, dependencies, runtimes and configuration.
Infrastructure intelligence	Matches app needs to supported AWS hosting patterns.
Cost + security intelligence	Surfaces cost assumptions, vulnerabilities and risk.
AI reasoning	Explains findings and translates goals into requirements.
Controlled execution	Validates plans, authorizations, ownership and outcomes.

Built for teams without a platform team.

AWS capability for software organizations that value ownership and control.

PRIMARY

Startups & SaaS

Ship products on AWS without hiring a dedicated platform team.

PRIMARY

Development teams

Standardize deployments while retaining operational visibility.

SECONDARY

Agencies & consultancies

Manage multiple client projects with clearer ownership and handoff.

B2B SAAS REVENUE

Subscription-based platform

Organization size • Projects • Team membership • Usage

INFRASTRUCTURE BILLING

AWS stays in the customer account

Go to market: pilot teams → validation → SaaS rollout

A working foundation. A focused path to product.

Commercialization begins with reliability, then expands into intelligence and operations.

EXISTING FOUNDATION

Already built

- GitHub-connected workflows
- React + NestJS + PostgreSQL
- GitHub Actions + Terraform
- AWS ECS Fargate + ECR
- Railpack builds; security and cost integrations

CURRENT PRIORITY

Hardening now

- Deployment lifecycle reliability
- Safe AWS resource ownership and deletion
- Consistent backend / workflow contracts
- Maintainable engineering architecture

PLANNED PRODUCT

Coming next

- Intelligence Harness + prompt-based planning
- Additional certified AWS hosting options
- Integrated cost and monitoring intelligence
- Operational evidence and governed recovery

Product note: AI-powered planning and self-healing are roadmap capabilities, not currently released features.

07 / THE VISION

Make AWS engineering accessible to every software team.

Without compromising infrastructure ownership, explainability or operational control.

- UNDERSTAND
- EXPLAIN
- VERIFY

WE ARE LOOKING FOR

Design partners & early adopters

- Startup mentorship
- Early pilot customers
- AWS / DevOps feedback
- Strategic partnerships
