DeployGuard can expand beyond traditional DevOps into secure AI application deployment and operations (AgentOps).

Here are the capabilities worth considering:

Feature	What DeployGuard could provide
1. AI Agent Deployment	Deploy AI agents, chatbots and LLM applications to AWS with minimal configuration.
2. Zero-Trust Permissions	Give each AI agent limited, temporary AWS permissions instead of unrestricted access.
3. Action Approval System	Require human approval before agents perform risky operations, such as deleting production resources.
4. Policy-as-Code	Enforce rules like "No public databases" or "No production deletion without approval."
5. AI Agent Monitoring	Monitor agent errors, latency, execution loops, API requests and token consumption.
6. Agent Cost Intelligence	Track AWS infrastructure costs alongside AI model/API costs to estimate total operating expenses.
7. AI Audit Trails	Record which agent requested an action, why, who approved it and what happened.
8. Agent Sandbox	Run untrusted agent-generated code in isolated environments with restricted access.
9. Multi-Agent Orchestration	Manage multiple agents using controlled workflows, timeouts and shared execution state.
10. Emergency Kill Switch	Stop runaway agents, disable their access and prevent further operations.
11. Secure Tool Integration	Let agents connect to approved APIs and databases through validated, permission-controlled interfaces.
12. AI Reliability & Recovery	Detect failing agents, alert operators and provide controlled recovery or rollback options.

What should DeployGuard prioritize?

Phase 1 — Build on existing strengths

Zero-trust AWS permissions, deployment approvals, audit trails, monitoring and reliable cleanup.

Phase 2 — Introduce AgentOps

AI agent deployment, runtime monitoring, cost tracking and emergency controls.

Phase 3 — Advanced Agent Governance

Multi-agent orchestration, intent verification, secure tool discovery and behavioral anomaly detection.

My recommendation: Don't implement all 12 now. First stabilize and certify DeployGuard's current AWS capabilities. Then validate customer demand for AI Agent Deployment + Security + Monitoring + Cost Control.

That combination could create a meaningful competitive direction: DeployGuard as a secure AWS deployment and operations platform for traditional applications and AI agents.
